

# LA-UR-13-24213

Approved for public release; distribution is unlimited.

Title: Godiva IV Assembly and Startup

Author(s): Goda, Joetta M.

Intended for: Nuclear Criticality Safety Program (NCSP) FY2013 Technical Review Program, 2013-05-30 (Washington, District Of Columbia, United States)  
For publication in unclassified minutes of meeting. LA-CP 13-00642 was presented at meeting.

Issued: 2013-06-10

UNCLASSIFIED

# Godiva IV Reassembly and Startup

**Joetta Goda**

**May 2013**

## Godiva Assembly Overview

- Cylindrical uranium metal fast burst assembly
- 65 kg, 93% enriched
- 7-inch diameter (17.8 cm), 6-inch tall (15.2 cm)
- Core without safety block or control rods
  - Multiplication  $\sim 10$
  - $k_{\text{eff}} \sim 0.9$
- Assembly/Disassembly activity *rarely* performed
  - 2005
  - 1989

## Criticality Safety

---

- Fire suppression system shall be disabled during assembly operations.
- Fire suppression efforts or agents of any type are NOT allowed.
- Table positioned  $\geq 3$  feet from any concrete surface.
- Demarcated 3-inch buffer boundary.
- Full core must be in the hydraulic press or within the buffer boundary.
- Maximum of 2 personnel may be within 2 feet of the full core when the Saturn ring is off.
- Assembly table height  $\geq 41$  inches

UNCLASSIFIED

## Install Control Rods, Burst Rod, and Safety Block

- Measured position of top of control elements relative to top of Godiva stand at both out and in positions.

UNCLASSIFIED

## Upper Fuel Assembly

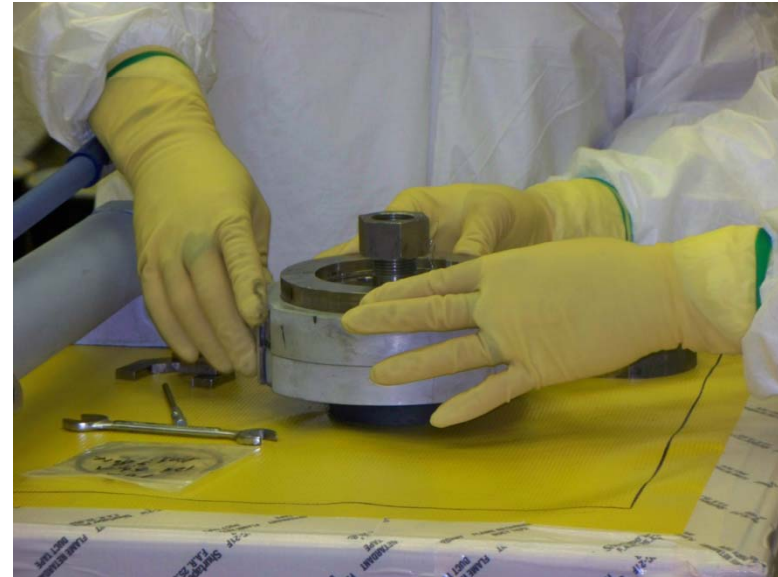

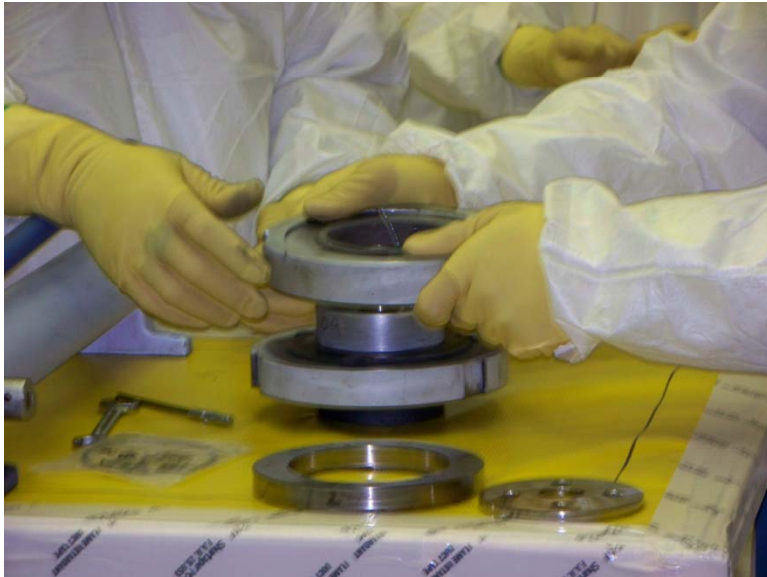

- Thicker shim ring constructed to compensate for fuel lost over time.

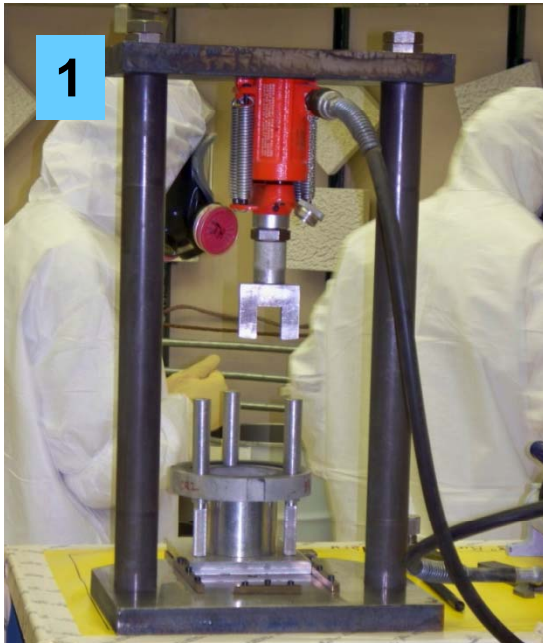

UNCLASSIFIED

## Upper Fuel Assembly (continued)

- Load bearing steel ring placed on top of fuel

## Stack the Lower Core

2

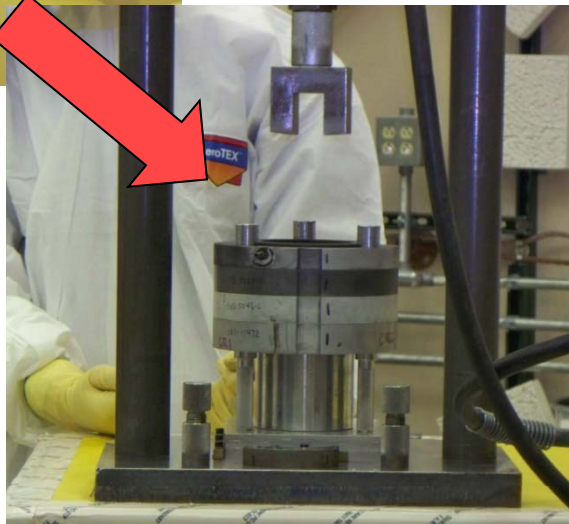

- Alignment of grooves absolutely essential

## Place Upper Fuel on Lower Fuel

- Upper assembly lifted by crane and lowered onto lower stack.

- Audible indication of increased multiplication as upper assembly is lowered onto stack.

## Install the C-Clamps

- First clamp is easiest.
- Iterate to get all clamps seated satisfactorily.

## Install the Support Legs

---

- Core is suspended while legs are attached.

## Install the Saturn Ring

- Bolts are tensioned outward.

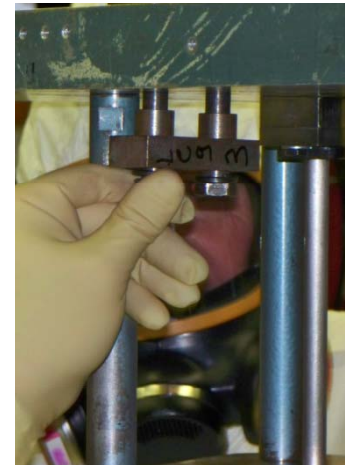

- Measuring and adjusting for equal distance to ensure even tension.

## Install the Core

- Table is rolled next to stand.
- Core lowered *carefully* over protruding control rods.
- Brackets are bolted on.

## Install the Core (continued)

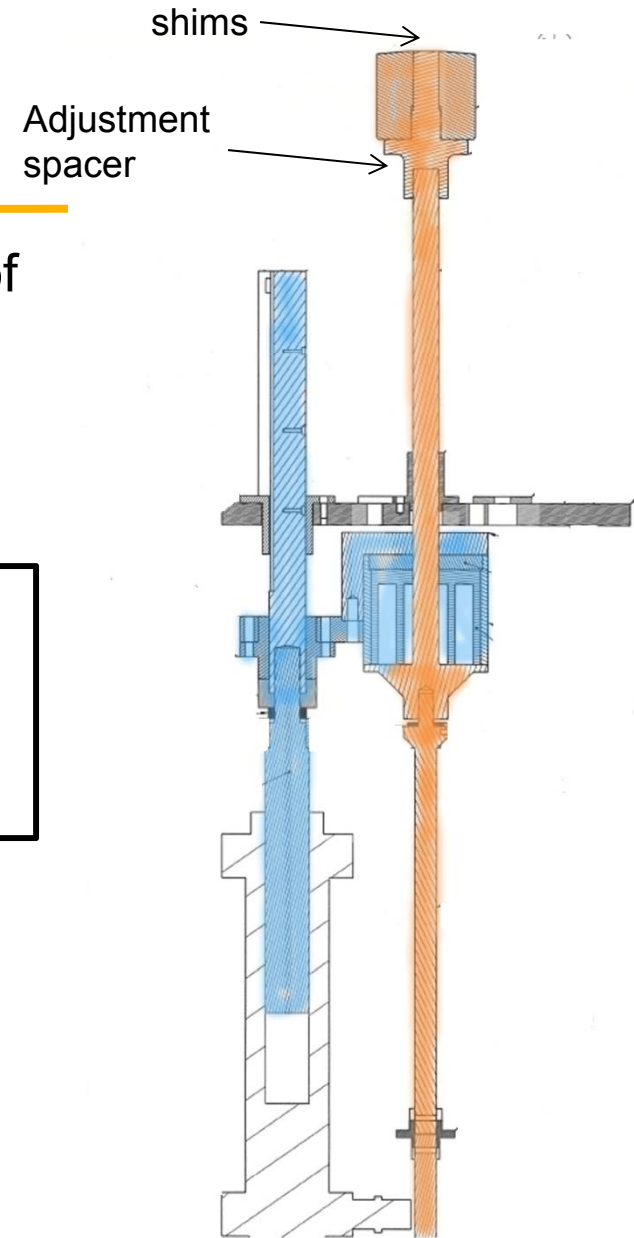

- Insert source in glory hole.
- Take subcritical neutron multiplication measurements.
- Results consistent with disassembly, multiplication  $\sim 8$ .

## Set the Safety Block Gap

- Use combinations of shims placed on top of Safety Block to measure gap distance
- Adjust Safety Block Position with spacer
- Repeat to measure gap distance.

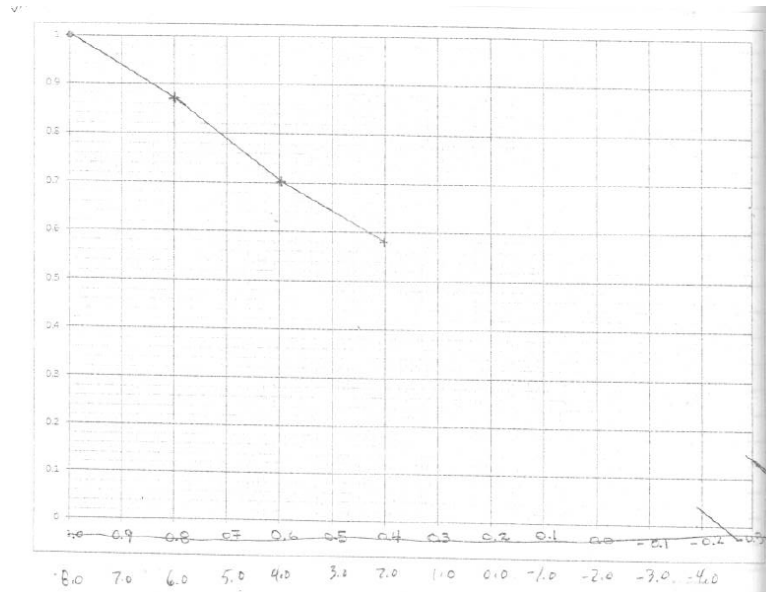

Gap distance is between the thickness of shims where Safety Block will drop out and next smaller amount of shims where Safety Block will not drop out.

- Final gap distance is 0.0145" - 0.0175"

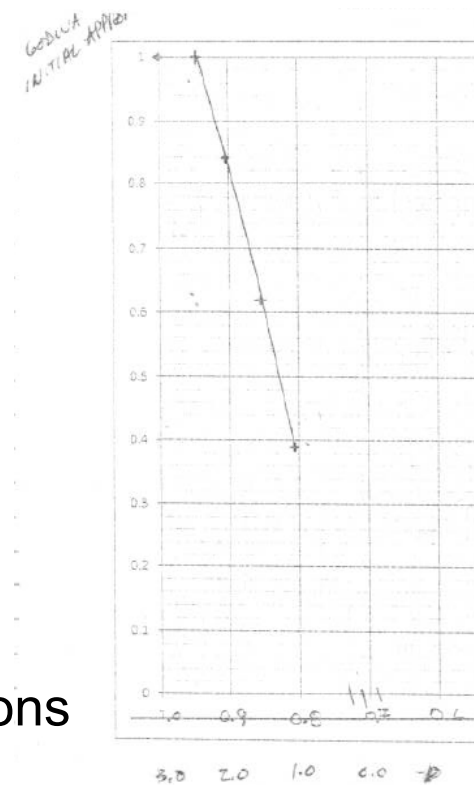

## Approach to Critical

- 1/M on Safety Block position

- 1/M on Sum of Control Rod positions

## First Critical at DAF

- Excess reactivity \$1.07 compared to \$1.23 prior to disassembly

72 PROJECT NAME First Critical @ DAF NOTEBOOK NO.

## Reproducibility of Control Elements

### Control Rod

- Insert CR 1
- Find DC with CR 2
- Record CR 2 position
- Remove CR 2
- Repeat

$0.250 \pm 0.001$  in

$\pm 0.04$  ¢

### Safety Block

- Establish positive period
- Measure period
- Remove SB
- Insert SB
- Repeat

$45.07 \pm 0.59$  sec

$\pm 0.15$  ¢

### Burst Rod

- Insert BR
- Establish positive period
- Measure period
- Remove BR
- Repeat

$21.34 \pm 0.41$  sec

$\pm 0.29$  ¢

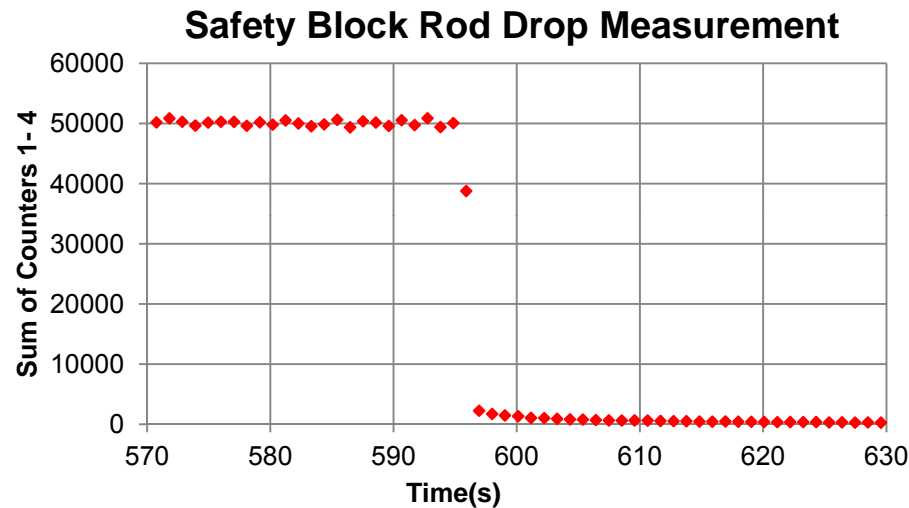

- Comparable to values measured during 1993 restart

## Burst Operation

---

1. Move Control Rod 2 to 0.500"
2. Find DC with Control Rod 1
3. Insert (or remove) burst increment with Control Rod 2  
(nominally 95 mils for 70° burst, 150 mils for 100° burst)
4. Retract safety block 2-5 inches
5. Unlock 3<sup>rd</sup> burst button, enter BURST OPERATIONS
6. Wait 15-20 minutes for delayed neutron decay
7. Arm instrumentation, Oscilloscope, trigger module
8. Insert safety block
9. Immediately insert burst rod (requires both crew members)

## Safety Block Rate of Shutdown

$$\rho(\$) = 1 - \frac{n_0}{n_1}$$

$$\rho(\$) = 1 - \frac{50082}{2256}$$

$$\rho(\$) = 1 - 22$$

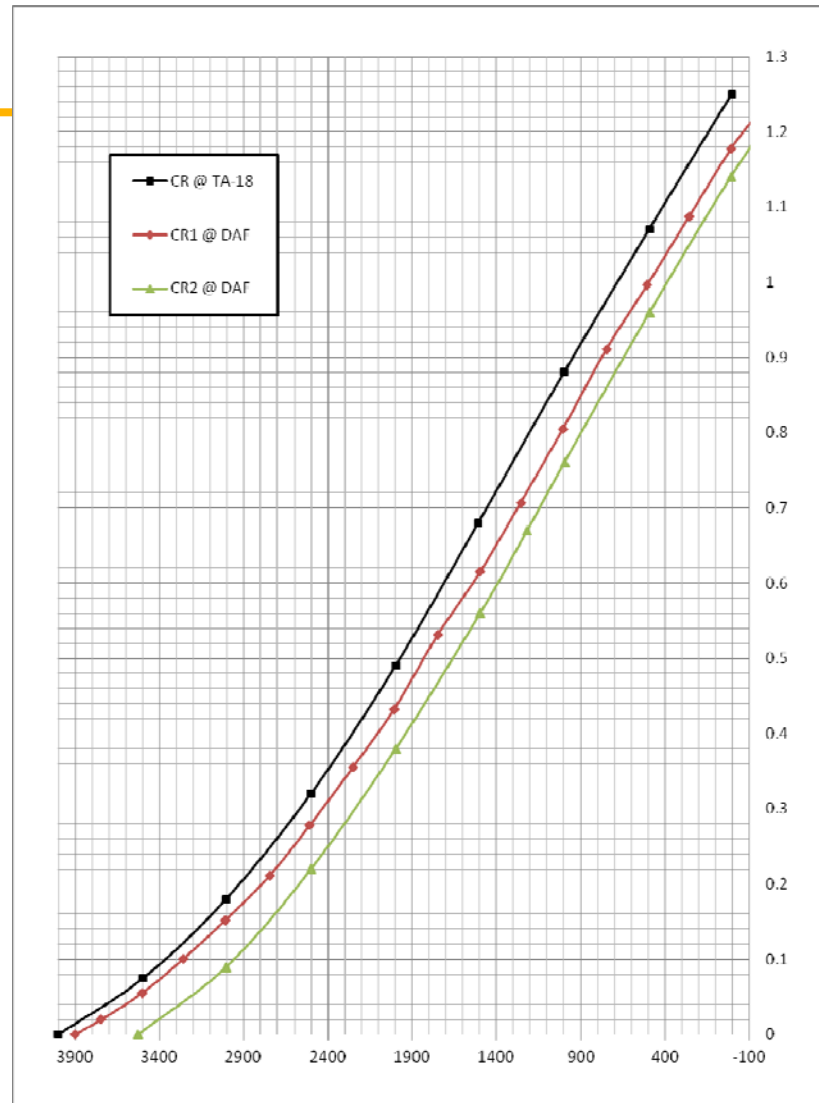

$$\rho(\$) \approx -\$21$$

$$\Delta t = 2 \text{ s}$$

- Shutdown Rate is approx. -\$10/s

\* ADJUSTED REACTIVITY INCREMENT TO ACCOUNT FOR \$0.02 ON BR.

+ \$0.03 ADJUSTMENT

\*\* \$0.04 Adjustment

## Burst Reproducibility

- Establish DC
- Remove burst increment
- Remove SB
- Wait
- Insert SB
- Insert BR/burst
- BR out
- Repeat

$90.69 \pm 0.13 \text{ } \phi$

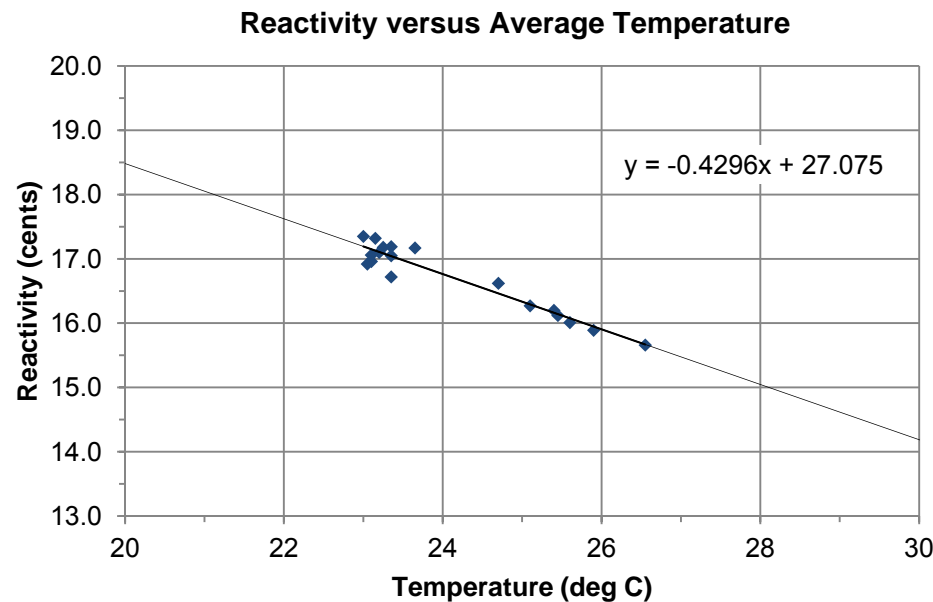

- Establish DC
- Remove burst increment
- Remove SB
- Wait
- Insert SB
- Insert BR/burst
- BR out
- Repeat

$90.19 \pm 0.03 \text{ } \phi$

## Reactivity Quenching (Temperature Coefficient)

- For characterization plan, we started on a positive period and showed that as temperature increased, period decreased.
- A free run would also demonstrate a negative temperature coefficient.
- Enough variation in room temperature over characterization to plot excess reactivity versus temperature.

- 0.4 cents/°C

## Approach-to-Prompt

- Perform successively larger bursts
  - Most accurate determination of rod worth
  - Demonstrates process
